VIDEO 1 TRANSCRIPT:

The tip I'm about to show you will
completely change the way you think about and approach a low-FODMAP diet. In fact, it's the fastest and easiest way to get started, and you don't even need a meal plan to follow.

Now, I'm going to leave you hanging for a bit because I want to introduce myself. It will be rude not to. My name is Joe Leech. I'm a dietitian. I particularly focus and create content around gut health, IBS, and the low-FODMAP diet. My website is dietvsdisease.org. If you want more information, you can always go there, and use the search bar, and hopefully, you find what you're looking for.

Now, when people typically start this diet, they ask for a meal plan, and it makes sense because meal plans can be really useful, but they're not useful for all of us, particularly if you create meals for your partner or you create meals for tiny humans in your house and you have a lot of kids to look after. Completely changing your eating pattern and what you eat each week is not really practical, and it's not ideal, so I tell people, "Well, why start a new meal plan when you don't have to? You don't have to reinvent the wheel."

What am I talking about? Let me show you. I tell people to simply modify what they already eat. What they ... Okay. Hopefully, you can read that. My writing is pretty messy. I promise, that was as neat as I could do it. Tell them to modify what they already eat. How do we do that? Three steps. Let us keep this as a pointer.

Step one. You list out ingredients of a few of the most common meals you have. For example, you might eat, I don't know, spaghetti bolognese on one night, and some other nights, you might have fish tacos. I don't know. I obviously didn't really plan that far ahead, but write ... You think about some meals you already do, and list out what the ingredients have you have.

Now, step two. How much of the ingredients are in your serving? You want to think about that as well in terms of portions because, obviously, portion sizes are important for the low-FODMAP diet. Step number three. Use a low-FODMAP list to swap out the high-FODMAP ingredients in the foods you already eat and swap in low-FODMAP alternatives. When I say use a low-FODMAP list, you can use the Monash University low-FODMAP app in App Store. I have a list, which is based on what's been released in research papers.

Now, I realize people watching won't have it, but I can put that in the comments. For example, I have that on my website. You can get it for free. It's a list of ... It's an eat-this-not-that list, things you can eat and things you can eat instead, so it's easy to swap.

Now, all of a sudden, you're making meals that ... You're just modifying meals that you already have, and you're making them low-FODMAP rather than tossing all your favorites out and eating low-FODMAP garden salads and things, so this is foods you already know you and your family like. You're just going to modify them slightly to be low-FODMAP.

Let's do an example. Okay? An example of how you can modify what you already eat rather than going from scratch, so let's go with the spaghetti bolognese example. In

Australia, we call it "spag bol" or "spag bog" for short, spaghetti bolognese. I've got "spag bol" here. I would love to hear what you call spaghetti bolognese for short. We shorten everything.

In spag bol, let's say you normally eat ... Okay. Spaghetti, the regular spaghetti. You have pasta, pasta sauce like pre-made pasta sauce in a bottle. Hopefully, you can read that and it's big enough. What else do we have? We usually have sauce and pasta. We might have some ... People might put some garlic and onion. For those planning at home, that's obviously high-FODMAP, so we're going to have to remove that. What else? Oh, yeah. Duh, maybe you have beef mince. Ugh, it's boring. Okay. Mushroom as well. Yeah. Now, we're talking.

This is the normal meal that you eat with your family on Mondays or whatever, and you like to take leftovers to work because it's super easy, so great. What's high-FODMAP here? Well, this is where you whip out your list. Oh, and you know what portions you have in particular, so you might have 1 cup of spaghetti, one cup of sauce like you can estimate.

Now, you get out your list, and this is where we do the swaps. Now, I know lots of the list in my head already, so I can cheat into it quickly. Which ones are high-FODMAP here? Spaghetti is. Spaghetti got fructans in it because it's from wheat flour just like bread, so high-FODMAP. Pasta sauce. Yes and no. It depends on what's ... the ingredients in the pasta sauce, and 9 times out of 10, they're going to have garlic and/or onion or something else high-FODMAP in ingredients, so you want to read the ingredients label and make sure you sauce it out, but let's assume that that's high-FODMAP.

We're starting to run out of foods here. Garlic and onion? Well, we know that's high-FODMAP. Beef mince? FODMAPs are ... They come from plant ... They come from carbohydrates, so plant-based foods. In terms of meat, and fish, and eggs, they are all good. They don't have any FODMAPs in them at all. That's fine, and mushroom. Unfortunately, one of my favorite things in the world. At least in the elimination phase. It's a temporary phase. We're being strict. We're going to cut them out.

We need swaps for these. Not beef mince, but for these ones. When you've got your FODMAP swaps list or using Monash University app, then this becomes really easy, so what can we swap them in? Gluten-free spaghetti. Not that gluten is a FODMAP. Gluten is not a FODMAP. It's a protein, but when gluten is taken out, the fructans in the wheat are all ... a lot of them are also removed, so you end up with ... So, gluten-free products are low-FODMAP too. To an extent, portion size matters, but you can have one cup of spaghetti, cooked spaghetti, for example. Whereas normal spaghetti would be high-FODMAP.

Pasta sauce. Okay. Well, tomatoes, if you look on the list, tomatoes are low-FODMAP, so we could instead just use tomato canned ... tinned. What do you call it? Tinned tomatoes. Whole tomatoes or crushing it. Whatever. As long as the ingredients list says, "Tomatoes. Salt." That's what it's going to say. Maybe water. Low-FODMAP, so that's the sauce.

Garlic and onion. Hmm, yeah. We can use like spring onion, the green tops of like ... They look like chives. What else are they called? Shallots? We could use that, or you could use like garlic-infused oil. It's not a big deal really if we didn't have the garlic flavor. Let's just put garlic-infused oil. Olive oil. OO, Olive Oil. Beef mince. The same. Kind of mushroom. A low-FODMAP alternative. I mean, there's types of mushroom you can have, but let's just say

shredded carrot because I'm biased, and that's what I do, and I think people should be eating more carrot because they're delicious.

Now, you've got gluten-free spaghetti, which people can't even tell anyway. Tinned tomatoes. Garlic-infused olive oil, so maybe you'd cook the mince in that first, and then add the tomatoes and the carrot, and then put it on the spaghetti. We've got carrot. Mince is the same. We've got carrot instead of mushroom, and all of a sudden, you're still having spag bol, good old spag bol, but it's low-FODMAP, and so when you serve it at home, your kids don't notice and your partner probably won't even notice either. Maybe. Maybe they'll notice slightly with the spaghetti, but no one is going to be the wiser, and you'll still have some leftovers that you can take for lunch tomorrow, and that is low-FODMAP.

Think about that. You can do that with all your meals, really. To recap ... Well, I want to rub it off. To recap, you want to identify your most common meals, so sit down and write what they are. What are the ingredients that you use in those meals? You can write them out, and then you want to swap them, the high-FODMAP ingredients for low-FODMAP ones. Think about your portions as well. If you're eating a big gigantic bowl of gluten-free pasta, you might still get an upset tummy, so being sensible about that.

Yeah. Yeah, swapping those ingredients out, and there you have it. That's how you modify what you already have, and I think this is really the easiest way to get going. Of course, a meal plan can help if you want more ideas, but I tell people if they're cooking for others, and they're busy, and they got, yeah, tiny humans to feed, this is the best way to go about it.

That's all I got. If you enjoyed this, let me know in the comments. Hey, if you've got some ideas or questions, I'll try to reply to them all. More importantly, if you know someone who would really enjoy this video or find it useful, please tag them in the comments or you can share the video, of course. That would be great as well. Yeah, speak soon.

VIDEO 2 TRANSCRIPT:

Hey, everyone, it's Joe here. So I want to look at how to create your go-to meals. Now these are super important. This, I feel, is the easiest way to ease into the low FODMAP diet, rather than necessarily jumping straight into a meal plan, a lot of people find it easier to ease into it and modify what they already eat, rather than eating something completely new.

So there's four steps. Step one, list out the ingredients of your usual got-to meals. So these are the two or three meals that you typically eat in a week. Most of us, we have meals that we typically cook each week. And we know either our partner likes them or our kids, our family. Number two, figure out how much of each ingredient would be in one serving for you. 'Cause typically, you'd make it in a batch for more people than one. So the amount you would normally eat of the meal. Number three, use the Eat This, Not That, FODMAPS food list that you have to help you swap in low-FODMAP ingredients for the usual high-FODMAP ingredients that you use. And number four is blocked by my head. Now you have some low-FODMAP versions of your and your family's favorite FODMAP meals. So let's do an example.

For example, say you typically had ... You baked chicken breasts in the oven or something, or you fried it. And you had garlic aioli, plain rice on the side. You might have half an avocado and some regular mushrooms. So now on the right, you can see the screenshot of the list that you'll have access to. Eat This, under green is what you can eat, and on the right, is red, don't eat that, they're

high-FODMAP. I strongly recommend, if you haven't already, to get the Monash University FODMAPs app. They have specific quantities of foods that you can eat, if you want to get really particular. They don't allow me to tell you all the quantities because of the terms of service of their app. But you can definitely get by with this list. It's pretty straightforward.

So you can see that on this ... Do I have a cursor? Yes. On this first arrow here, mushrooms, tinned. Tinned mushrooms are low-FODMAP. It's a long process to do with the packaging and a lot of the FODMAPs are lost in the water, when you tip it out, that's why. Anyway. High-FODMAP, garlic, definitely. And all other mushroom types, basically. There's some exceptions. Shimeji and oyster as well, but all other types, high-FODMAP. So in red, I've got what's high-FODMAP in your typical meal that you eat. The garlic aioli, avocado. Sorry, avocado's down here in fruit. Very small quantities. One-eighth of an avocado is low-FODMAP. Portion size is very important.

If you eat more than that, it goes past your FODMAP threshold, and can trigger symptoms. So that's why portion size is super important to understand as well. So half an avocado is a lot of an avocado, and that's high-FODMAP. And then of course, regular mushroom. So how can we modify this meal to be low-FODMAP? Simple. We change the garlic aioli for another sauce. So in this instance, I put mustard. So in the screenshot here, I've just grabbed this part of the Eat This, Not That, food list. So in the sauce and condiments, under the green section, is mustard. So mustard is okay to have, in reasonable quantities. Don't go drinking mustard from the bottle, do you know what I mean? A tablespoon is plenty. There's also tomato ketchup, barbecue sauce. A tablespoon, two tablespoons, max. Low-FODMAP.

It's a good habit to practice eating fewer sauces. Less sauce, anyway, I think. Plain rice is fine. Rice is low-FODMAP. And then I've added in half a cup of broccoli instead of the avocado. So if you look up here, you can see, oh, broccoli is low-FODMAP. So we can put that in and that works alongside chicken and with some sauce. And then some rocket or arugula, as it's called in the US, that's also low-FODMAP. You can go for your [inaudible 00:04:29].

So swap that out for mushrooms. So now you have, essentially, a very similar meal, low-FODMAP. Easy. So let's do another example. Pasta bolognese, made with ground or minced beef, pre-made pasta sauce, mushrooms, and regular pasta. So in red, you can see that it's pre-made pasta sauce and mushrooms. We know about mushrooms already. Regular mushrooms are high-FODMAP. And regular pasta as well, is made from wheat. As we know, regular wheat is high-FODMAPs, high in fructans. So I've got here again, error to garlic and error to mushrooms. I should also have an arrow to onions as well. The reason is because pre-made pasta sauce, you'll find almost always has garlic and onion and other high-FODMAP powders in the ingredients list.

And for that reason, I recommend ... Unless you're familiar with reading labels, and if you've seen my label reading tutorial, and you're savvy, you can definitely pick out lots of pre-made pasta sauces that are low-FODMAP. But if you want to play it safe, it's easier just to use your own from tomatoes, which I'll get to. And then I've also pointed out ... So I've grabbed a snapshot from pasta, rice, and noodles. As I was saying, rice, all types, is low-FODMAP. From the last example. Couscous, gnocchi, pasta, egg noodles, udon, ramen, wheat noodles, they are high-FODMAP. So how do we modify this meal? So beef is fine, right? Beef, meat, fish, eggs, if they're plain. They've got no FODMAPs. FODMAPs come from plant-based foods. So they're fine. I've got two diced tomatoes.

You can see here, [inaudible 00:06:31] tomatoes. So tomatoes are low-FODMAP, so you can actually buy just your tinned tomatoes, that are just plain tinned tomatoes. Sometimes they serve

them diced or with chunk or even pureed. You can buy them. So use that as the sauce instead, and I've put, use spices other than garlic or onion powder. So you can actually add basil or oregano. All these spices are low-FODMAP. You can go for them. It's just ... The main spices are garlic and onion, that's the problem. So then you've just got the tomato-based sauce that you've made, that still tastes good. Shredded ... It says carrot. I'm blocking that word, and I can't move my thing. So carrots here. So I always ... This is from personal preference, but I always add shredded carrot to bolognese sauce, because it's such an easy way to add vegetables into the dish and make it more filling and more nutritious. And then one cup cooked gluten-free pasta, it says.

So down here, you can see pasta, gluten-free. So gluten-free wheat products are low-FODMAP, up to one cup cooked or two slices of bread. Long story short, removing the gluten also happens to remove the fructans, which are the FODMAP in wheat, so they're more tolerant. So now, if you create this dish at home, and you didn't tell your kids or your partner or whatever, chances are they won't even notice that it's different. And that's the best part. Super easy. Okay. So now it's your turn.

So I'll just recap what I did. So you need to quickly sit down. One of the things that we normally cook in the week, and list out the ingredients. That's point number two. And then how much of it would you normally eat? When I eat pasta, do I eat one cup of pasta? Cooked pasta? Or would it be more than that? And typically, it might be more than that. So you do also have to be mindful of portion sizes. Number three, now you've got the Eat This, Not That FODMAPs food list, and you're going to say, okay, here's the ingredients that I use. Some of these are higher, I can see they're in the high category.

What can I swap for on the green side so that it's low-FODMAP. Simple swaps. And now you have some low-FODMAP versions of you and your family's favorite meals. Easy. And then you can really ease into the diet, and then start to think about other things after that. So I hope you found that useful. If you've got any questions, of course you could email me and I'll get back to you. Bye.
